

Your Single Source for Factory Automation

Get an unparalleled return on your automation investment.

MESH Engineering has been developing automated and semi-automated solutions for our customers in pharmaceutical, medical device, automotive, consumer goods, industrial products, food and beverage industries since 1999.

Every phase of your production benefits from machines we design, build and program. Our machines process your individual parts, assemble those parts, and package and palletize them for shipment.

Processing

Assembly

Packaging

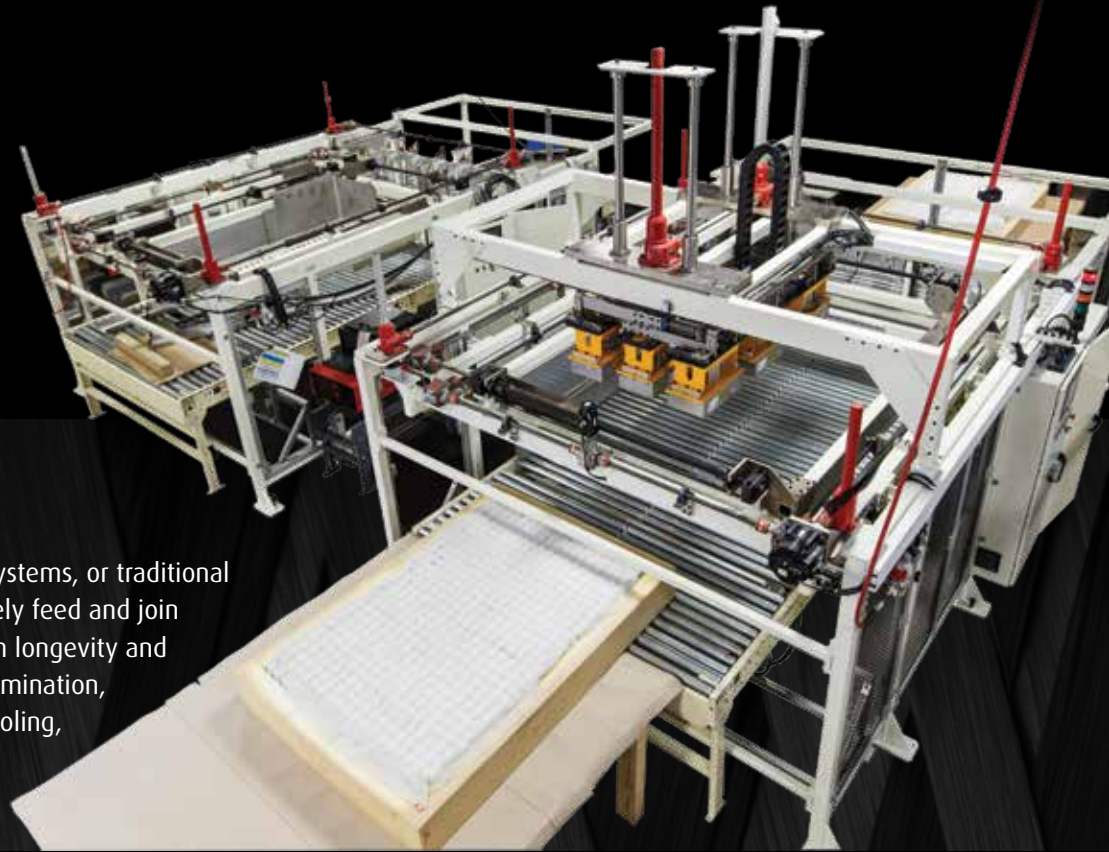

Processing

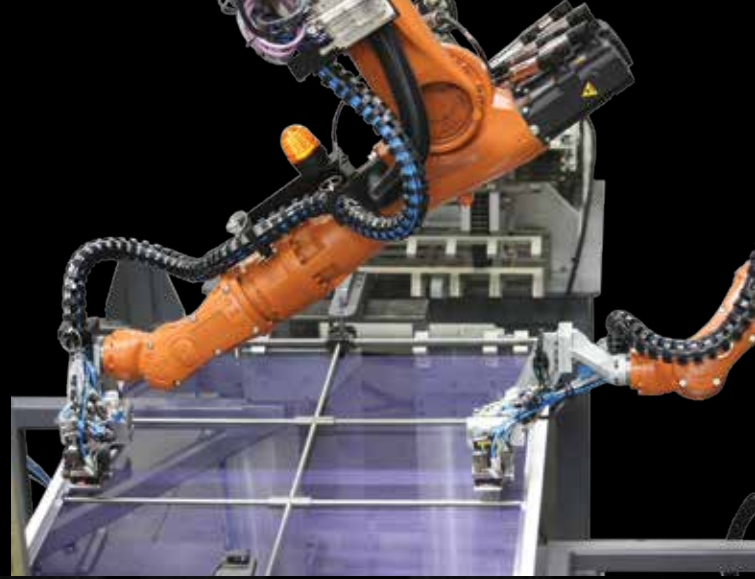

Put simply, we mechanize component manufacturing that is often repetitive, dangerous, and dirty and that requires consistent quality. This allows your people to do what they do best – think, create, and make decisions. If you can organize it – we can automate it!

Assembly

Use our robots with advanced vision systems, or traditional motion control, to quickly and accurately feed and join metal or plastic parts. You benefit from longevity and control of your processes with error elimination, in-line quality control, quick change tooling, and advanced data acquisition.

Packaging

We are also experts at incorporating robotics into packaging processes. Your packing and palletizing throughput is optimized to be as consistent as your manufacturing processes – and uses many of the same automation principles. You know where it is, where it is going and when it gets there.
